

OVERVIEW OF ENDOVENOUS ABLATION FOLLOW-UP APPOINTMENTS

Initial Treatment Phase

After each ablation procedure, an ultrasound to check for blood clots will be scheduled 3-7 days following treatment.

Ultrasound guided sclerotherapy to address varicose “branches” is also usually done following the ablation.

The typical schedule for ultrasound guided sclerotherapy is:

- 1-2 weeks following the ablation
- 3-4 weeks later
- And 2-4 weeks later, **if needed**

Intermediate Treatment Phase

These appointments are to check up on the treated veins after treatment is finished. This is done with ultrasound.

Typically scheduled:

- 3-6 months after treatment is finished, and at
- 6-12 months

Depending on the results of the ultrasound and your symptoms, more treatment may be needed.

Long Term Phase

After the 12 month visit, we may recommend follow-up:

- Every 1-2 years for a routine ultrasound and follow-up visit with the doctor.
